16. ABSTRACT

Under the Toxic Substances Control Act, manufacturers, processors and importers may be required to submit certain data to EPA prior to the commercial production, processing or distribution of a new chemical or of a previously produced chemical intended for a new use. EPA may also collect the same data for existing chemicals in existing uses. This Chemical Use Classification System will allow manufacturers, processors and importers of chemicals to report chemical use data to EPA in a form that will facilitate analysis. This system includes a use classification scheme, an alphabetical index to the classification scheme, instructions describing how to report chemical use, production and exposure information, and a reporting form on which to code the above information.

Introduction

SECTION I. INTRODUCTION

1.1 RELATIONSHIP OF THE CHEMICAL USE CLASSIFICATION SYSTEM TO THE TOXIC SUBSTANCES CONTROL ACT

The Toxic Substances Control Act (PL 94-469), which became effective on January 1, 1977, makes the Environmental Protection Agency (EPA) responsible for regulating chemical substances "whose manufacture processing, distribution in commerce, use, or disposal may present an unreasonable risk of injury to health or the environment". The Act mandates that manufacturers, processors and importers of chemical substances submit certain data to EPA prior to the commercial production, processing or distribution of a new chemical or of a previously produced chemical intended for a new use and permits EPA to collect the same data for existing chemicals in existing uses. In addition to other information, reported data may include the chemical's intended use(s) and estimated production volume for each intended use. In determining what constitutes a significant new use of a chemical (with respect to which pre-market notification is required), EPA must consider additional factors, including the extent to which a use changes the type, magnitude and duration of human and environmental exposure to the chemical. These are areas of information to be considered by EPA under the Act, but they are not currently associated with any rulemaking activities.

Therefore, EPA has designed a Chemical Use Classification System which will allow manufacturers, processors and importers of chemicals to report the information described above in a form that will facilitate analysis by EPA. This system includes a use classification scheme, an alphabetical index to the classification scheme, instructions describing how to report chemical use, production and exposure information, and a reporting form on which to code the above information.

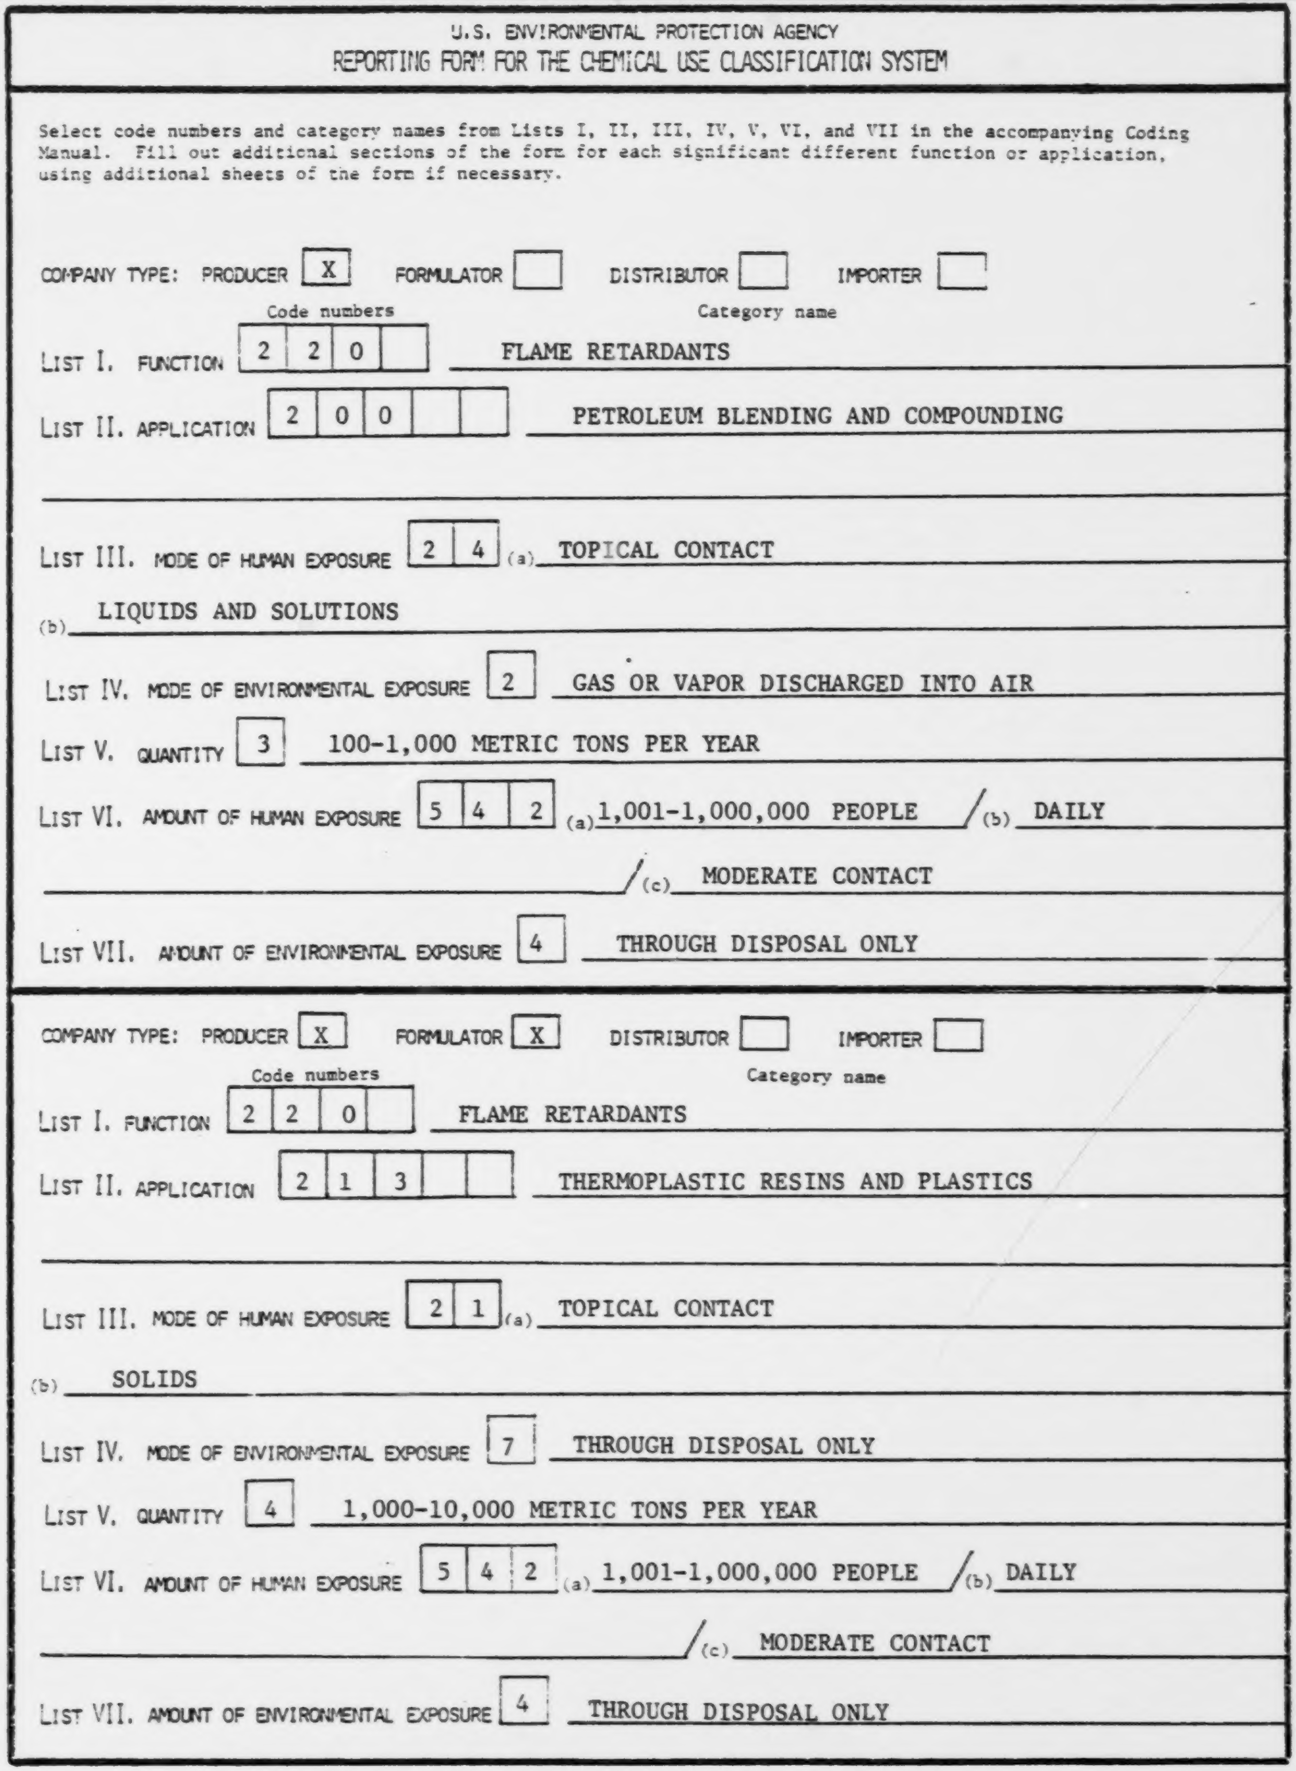
SECTION II. INSTRUCTIONS FOR COMPLETING THE REPORTING FORM

To complete the reporting form, you will need the indexes (Tabs C and E) and lists (Tabs D, F, and G through K) contained in this manual and copies of the "Reporting Form for the Chemical Use Classification System", hereinafter called the reporting form. An example of a completed reporting form is shown in Figure 1. The method for completing the reporting form is described below. If you cannot reasonably ascertain any given part of the requested information, leave that part of the reporting form blank.

2.1 COMPANY TYPE

With respect to any reported chemical use, a company may be considered a producer, formulator, distributor or importer. More than one of these designations may apply to a company with respect to any given use or uses of a chemical. For each use reported as described in Sections 2.2. and 2.3 below, check the company type or types which best describe the role of your company in relation to the use being reported for the chemical. Company types are defined as follows:



U.S. ENVIRONMENTAL PROTECTION AGENCY

Select code numbers and category names from Lists I, II, III, IV, V, VI, and VII in the accompanying Coding Manual. Fill out additional sections of the form for each significant different function or application, using additional sheets of the form if necessary.

Figure 1. Example of Completed Reporting Form for the Chemical Use Classification System

- A PRODUCER is any person (or organization) who makes a chemical compound by means of one or more chemical reactions,as in the production of an epoxy resin from epichlorohydrin.

- A FORMULATOR is any person (or organization) who mixes two or more chemical compounds in the absence of a chemical reaction to make a product, as in the formulation of an adhesive from an epoxy resin a tackifier, a solvent and a filler.

- A DISTRIBUTOR is any person (or organization) who purchases a chemical compound or product for resale, either in the same units or repackaged into units of a different size.

- An IMPORTER is any person (or organization) who brings a chemical compound or product from another country into the customs territory of the United States for the purpose of selling or using it.

2.2 LIST I (FUNCTION)

For the chemical substance being reported, list all of the uses for which you produce, or plan to produce, formulate, distribute or import the chemical. Do not report any use for which you do not produce, or plans to produce, formulate, distribute or import the chemical, even though you know them to be actual uses.

For reporting purposes, use has been divided into two segments: Function and Application. List I (Tab D) contains the functions of chemicals, or those actions for which chemicals are specially fitted or used. List II (Tab F; see description below) contains the applications of chemicals, or those processes or products in which chemical substances are used. For example, a chemical may function as a soil release agent for application to yarns and fabrics. Do not report as a use a subsequent production or formulation operation which results in a product that does not contain the chemical being reported. For example, if acrylonitrile functions as a polymer intermediate, and the resulting polyacrylonitrile is used in the formulation of coatings, report the function of acrylonitrile as a polymerization intermediate and the application as coatings. Do not report the function of acrylonitrile as a coating and the application as finished yarns and fabrics.

To complete the function designation, go to the index to List I (Tab C) and look for the category name or names which most nearly correspond to the function(s) of the chemical being reported. In searching the index, bear in mind that entries are listed in direct, rather than in inverted form. For example, the category "CYCLIC CHEMICALS" is listed as such, and not as "CHEMICALS, CYCLIC". Numerous synonyms have been included in the index to help you locate valid categories. Each valid category name has an associated code number of three or four digits. For each function category you select, look up the corresponding code number and category name in List I, which is arranged in numerical order, and determine whether the function to which it refers is the most specific function applicable to the chemical in question. Select the most specific applicable function category and write its code number in the boxes provided for List I. Then write out the List I category name on the line adjoining the coding boxes. For example, in reporting on an emulsion stabilizer, you should search the index for the category "emulsion stabilizers" and code this with its number, 3540, as shown below. You may also search the index to List I for the more general category, "stabilizers" and find the category "STABILIZERS 354". As a check to select the most specific category, you would then look up number 354 in List I and find the following:

354	STABILIZERS
3540	EMULSION STABILIZERS
3541	FOAM STABILIZERS
3542	HEAT STABILIZERS

Seeing that the category "EMULSION STABILIZERS" most closely corresponds to the function of the chemical, you would code:

	Code numbers	Category name
LIST I. FUNCTION	3 | 5 | 4 | 0	EMULSION STABILIZERS

Remember that since you may not locate the most specific category in the index, you should check the list itself.

Always begin coding the number in the leftmost box, even if the category has only a three digit code. Report as many different functions as applicable, using as many reporting forms as you need.

2.3 LIST II (APPLICATION)

To complete the application designation, go to the index to List II (Tab E) and look for the category name or names which most nearly correspond to the application(s) of the chemical being reported. For each application category you select, look up the corresponding code number and category name in List II, which is arranged in numerical order, and determine whether the application to which it refers is the most specific application available for the chemical in question. If you cannot find an appropriate application category in the List II index, return to the List I index and look for the application there. (See the special situation rule explained in Section 2.3.1 below.) Always begin coding in the leftmost box, except in the special situation described in Section 2.3.1 below. If more than one function from List I has been reported, be sure to match each application reported from List II with the appropriate function.

If you are reporting on AGRICULTURAL CHEMICALS or CHEMICAL INTERMEDIATES, please see Section 2.4 for specific instructions on how to proceed.

If you are seeking a category which is more specific than the most specific applicable category given in Lists I or II, use the more general category as given. For example, in reporting a chemical used as a binder for grinding wheels, you would look up the category "BINDERS" in the index to List I and would enter this term for List I. You might then look for the category "grinding wheels" in the index to List II. However, the closest appropriate category in List II is "ABRASIVE PRODUCTS", and this is the category you should select.

If, on the other hand, you do not know the specific application of a chemical, you may also report a more general application. For example, in the category group:

212	NONCELLULOSIC ORGANIC FIBERS
2120	ACRYLIC AND MODACRYLIC FIBERS
2121	POLYAMIDE FIBERS
2122	POLYESTER FIBERS
2123	POLYOLEFIN FIBERS

if you do not know the specific type of fiber in which a chemical is used, you may report "212 NONCELLULOSIC ORGANIC FIBERS."

If a single function has more than one application (List II), repeat the same function (List I) as many times as necessary to cover each application reported. For example, sodium silicate, when functioning as a binder, has applications in both paperboard container manufacture and iron and steel foundry product manufacture. This information would be coded as follows:

	Code numbers					Category name
LIST I. FUNCTION	0	9	8			BINDERS
LIST II. APPLICATION	1	9	3			PAPERBOARD CONTAINERS AND BOXES

.
.
.

	Code numbers					Category name
LIST I. FUNCTION	0	9	8			BINDERS
LIST II. APPLICATION	2	2	2			IRON AND STEEL FOUNDRY PRODUCTS

If you cannot find an appropriate category in either List I or II for the chemical you are reporting, you may create an appropriate category in the following manner. List I contains the category "291 OTHER". Use this category to report a new function, as follows:

	Code numbers				Category name
LIST I. FUNCTION	2	9	1		OTHER - (NEW CATEGORY NAME)

List II contains the category "MISCELLANEOUS PRODUCTS 16". Use this category to report a new application, as follows:

LIST II. APPLICATION	1	6				MISCELLANEOUS PRODUCTS -(NEW CATEGORY NAME)

Before adding new categories, however, examine the existing categories carefully for applicability.

2.3.1 Special Situation Rule for Using a Double Function

In certain cases, a chemical may have as its application not a process or product (which is the way this classification system defines application), but rather another function. For example, the chemical toluene may function as a solvent in the formulation of an adhesive. According to this classification system, both "solvent" and "adhesive" are considered functions. (The adhesive may later be used to laminate materials such as fabrics, plastics and wood, and as such would have a valid application in the context of the system.)

In this case, you would select two category names from List I and use them to report both function and application. Code the List I category number and name, describing function, as usual on the List I coding line. Code the List I category number and name being used, in this instance, to describe application, on the List II coding line, leaving a blank space in the leftmost box. The reporting form should appear as follows:

	Code numbers					Category name
LIST I. FUNCTION	3	5	2			SOLVENTS
LIST II. APPLICATION		0	0	9		ADHESIVES

2.4 SPECIAL REPORTING INSTRUCTIONS FOR AGRICULTURAL CHEMICALS AND CHEMICAL INTERMEDIATES

2.4.1 Agricultural Chemical Reporting

In the List II category, "AGRICULTURE, FORESTRY AND FISHING", crop-related applications such as fertilization, weed control and soil preparation are not included. Instead, you should report the application of a given chemical to a given crop or crops. For example, a fertilizer (List I) for cotton crops should be associated with the List II category, "COTTON PRODUCTION".

2.4.2 Chemical Intermediate Reporting

In the context of this classification system, a chemical intermediate is defined as a chemical compound which undergoes a chemical reaction to form one or more products which differ in composition and/or structure from the initial chemical compound. This definition excludes chemical compounds which are mixed with other compounds to make a formulated product without undergoing a chemical change. For example, benzene used in the manufacture of styrene would be considered a chemical intermediate. On the other hand, benzene used as a solvent in rubber cement would not be considered an intermediate.

In reporting on a chemical intermediate which is used to make more than one chemical substance of the same type (e.g., cyclic chemicals), report only one use and cumulate quantities and exposure data (as described in Section 2.5). If the chemical intermediate is used to make more than one type of chemical substance (e.g., acyclic chemicals and reagent and high purity grade chemicals), report as many uses as appropriate.

2.5 SPECIAL REPORTING INSTRUCTIONS FOR HUMAN AND ENVIRONMENTAL EXPOSURES AND PRODUCTION QUANTITY

To complete Lists III through VII, you will not have to refer to an index, but only to the lists themselves, (Tabs G through K). These are short and straightforward lists from which you can readily select the appropriate categories. Note that the items reported for these lists must correspond to the use of the chemical substance as reported for Lists I and II.

The instructions given below require reporting of human and environmental exposures during normal use for each use reported in Lists I and II. For the purposes of exposure reporting, "normal use" relates only to final end use, as opposed to in-plant use. Thus, if a company is reporting on titanium dioxide as a paint pigment, the reported exposures should not be to in-plant personnel who are formulating the paint (or to the production-related environmental exposures), but to the customers in the general population who buy the paint for application as a surface coating.

If a situation is envisioned in which people or the environment could be exposed differently with respect to a single use, reporting should be on the "cumulative exposure", which is a summation of the different exposure levels and types involved. For example, if up to 1,000 people would be exposed to a chemical substance through topical contact and 10,000 people would be exposed through inhalation, a firm would report that "1,001 to 1,000,000 people are exposed through "both topical contact and inhalation". A firm should not report that "11 to 1,000 people" are exposed through "topical contact" and "1,001 to 1,000,000 people" are exposed through "inhalation".
For the List III Part (b) categories (Form of Exposure), which cannot be reported in a cumulative fashion, report only the physical form in which the greatest quantity of chemical exists. Likewise, for the List IV (Mode of Environmental Exposure) categories, report only the particular mode in which the greatest quantity of chemical escapes into the environment.

2.6 LIST III (MODE OF HUMAN EXPOSURE)

List III is divided into two parts, each of which characterizes a different aspect of the mode of human exposure to a chemical.

2.6.1 Part II (a)

Part (a) of List III (Tab G) categorizes the mode of human exposure to the chemical in terms of point(s) of human contact with the chemical during normal use. Select the category which describes the human point(s) of contact with the chemical (for each use reported). Enter the category code number in the leftmost box for List III and write out the point or points of contact.

2.6.2 Part III (b)

Part (b) of List III characterizes the form of exposure to an end product. Categories in this part represent the various physical forms in which the end product containing the chemical may exist. For example, if a company uses powdered titanium dioxide as a pigment in paint formulation, the end product (paint) will be a suspension and should be reported in Part III (b) as a 3 (suspensions and emulsions). Please note that chemicals used as intermediates in chemical reactions are exempt from reporting in this section, because the chemical intermediate does not exist, except incidentally, in the end product. In this case, report "0" (not applicable) for Part III (b).

Select the category which describes the physical form of the end product (for each use reported) and enter the code number in the rightmost box for List III. Write out the term describing the form of exposure in Part (b) of the corresponding line. The example below shows how List III coding should appear:

LIST III. MODE OF HUMAN EXPOSURE | 6 | 5 | (a) topical contact and inhalation
(b) mists and aerosols

2.7 LIST IV (MODE OF ENVIRONMENTAL EXPOSURE)

List IV (Tab H) categorizes the types and modes of discharge of the chemical into the environment during normal use. Select the category which best describes the type and mode of discharge (for each use reported). Enter the category code number in the box for List IV and write out the mode of environmental exposure, e.g.,

LIST IV. MODE OF ENVIRONMENTAL EXPOSURE ☐ 2 gas or vapor into ambient air

2.8 LIST V (QUANTITY)

List V classifies quantities of the chemical produced or used in terms of metric tons of chemical per year. If you have reported your company as a producer, the quantity reported will refer to the quantity of chemical produced for the reported use. If you have reported your company as a formulator, the quantity reported will refer to the quantity of chemical used in formulating the product reported. If you have reported your company as a distributor or importer, the quantity reported will refer to the quantity of chemical sold for the reported use.

Select the category from List V (Tab I) which includes the estimated amount of the chemical which you produce, formulate, distribute or import annually for each use reported. Write the single code number in the box for List V, and then write out the quantity corresponding to that code number, e.g.,

LIST V. QUANTITY ☐ 0 UP TO AND INCLUDING .5 METRIC TONS

2.9 LIST VI (AMOUNT OF HUMAN EXPOSURE)

List VI (Tab J) is divided into three parts, each of which is designed to characterize a different aspect of human exposure to the reported chemical.

2.9.1 Part VI (a)

Part (a) of List VI categorizes the number of people who would come into contact with the chemical substance during normal use. Select the category from Part (a) which includes your estimate of the exposed population (for each use reported), and enter the corresponding code number in the leftmost box for List VI. Write out the number of people in Part (a) of the corresponding line.

2.9.2 Part VI (b)

Part (b) of List VI categorizes the frequency with which people come into contact with the chemical substance during normal use. Select the category which most nearly corresponds to your estimate of the frequency of contact (for each use reported), and enter the code number in the middle box for List VI. Write out the frequency in Part (b) of the corresponding line.

2.9.3 Part VI (c)

Part (c) of List VI categorizes the extent of exposure of a person during normal use of the chemical. Select the category which best corresponds to your estimate of the extent of exposure (for each use reported), and enter the code number in the rightmost box for List VI. Write out the extent of exposure in Part (c) of the corresponding line. The example below shows how List VI coding should appear:

LIST VI. AMOUNT OF HUMAN EXPOSURE [7 | 2 |] (a) more than 1,000,000 people / (b) yearly

/ (c) light contact

2.10 LIST VII (AMOUNT OF ENVIRONMENTAL EXPOSURE)

List VII (Tab K) categorizes the extent of environmental exposure to the chemical in terms of the approximate amount of chemical substance which enters the environment during normal use. Select the category which best corresponds to your estimate of the amount of chemical released into the environment (for each use reported), and enter the code number in the box for List VII. Write out the amount of environmental exposure on the corresponding line, e.g.,

LIST VII AMOUNT OF ENVIRONMENTAL EXPOSURE $\boxed{1}$ up to 1% of substance

List III

LIST III: Mode of Human Exposure

Part (a) • Part (a) characterizes point of human contact with substance during normal use as follows:

0 = no contact
1 = oral contact
2 = topical contact
3 = both oral and topical contact
4 = inhalation
5 = both oral contact and inhalation
6 = both topical contact and inhalation
7 = oral and topical contact and inhalation
8 = contact through injection
9 = contact through injection together with one or more other types of contact

Part (b) • Part (b) characterizes the form of exposure in terms of the physical state of the end product that contains the reported chemical.

0 = not applicable
1 = solids
2 = respirable size particulates
3 = suspensions and emulsions
4 = liquids and solutions
5 = mists and aerosols
6 = gases and vapors

LIST IV. Mode of Environmental Exposure

- Characterizes type and mode of discharge during normal use* of substance as follows:

  0 = no discharge into environment
  1 = particulate discharged into ambient atmosphere (discharge which settles)
  2 = gas or vapor discharged into ambient atmosphere (discharge which disperses)
  3 = liquid or solution discharged into water
  4 = bulk solid, suspension or particulate discharged into water
  5 = bulk solid or particulate discharged on or into the soil
  6 = liquid discharged into the soil
  7 = discharge through disposal only

---

*Reporting should be limited to normal use. The classification system is not intended to cover accidents resulting in environmental exposure.

LIST V. Quantity

- Quantity is characterized in terms of metric tons* produced or used per year** as follows:

0 = up to and including .5 metric tons per year (1,000 lbs.=.45 metric tons)

1 = greater than .5, up to and including 10 metric tons per year

2 = greater than 10, up to and including 100 metric tons per year

3 = greater than 100, up to and including 1,000 metric tons per year

4 = greater than 1,000, up to and including 10,000 metric tons per year

5 = greater than 10,000, up to and including 100,000 metric tons per year

6 = greater than 100,000, up to and including one million metric tons per year

7 = greater than one million, up to and including 10 million metric tons per year

8 = greater than 10 million, up to and including 100 million metric tons per year

9 = greater than 100 million metric tons per year

---

[*] 1 metric ton - 2204 lbs.

[**] If production or use is on a periodic basis, quantity should be reported on an average annual basis.

LIST VI: Amount of Human Exposure

Part (a) • Part (a) characterizes the number of people estimated to to be in contact with the substance during normal use. People who come into contact with the substance include not only those people who handle the substance directly, but also those people in the vicinity of the substance who might inhale it, touch it, get it on their clothes, etc.)

1 = up to 10 people
3 = 11 to 1,000 people
5 = 1,001 to 1,000,000 people
7 = more than 1,000,000 people

Part (b) • Part (b) characterizes the estimated average frequency of contact for those people, as follows:

1 = less frequently than once a year
2 = yearly
3 = monthly
4 = daily
5 = prolonged or continuous

Part (c) • Part (c) characterizes the extent of contact as follows:

0 = no contact
1 = light contact
2 = moderate contact
3 = heavy contact

- Definitions:

Light contact: Normal use of the substance results in contact with no more than minute quantities of the substance. For example, use of an aerosol insecticide outdoors.

Moderate contact: Normal use of the substance results in contact with a noticeable quantity of the substance. For example, use of aerosol deodorant in a well ventilated room.

Heavy contact: Normal use of the substance results in contact with a large quantity of the substance. For example, use of hairspray in an unventilated room.

LIST VII. Amount of Environmental Exposure

- Amount of substance entering the environment during normal use, as follows:

  0 = none

  1 = up to 1% of substance

  2 = more than 1%, up to and including 10% of substance

  3 = more than 10%, up to and including 100% of substance

  4 = through disposal only
